Property Submarket Analysis Report

Executive Summary

The subject property at 1824 Nw 32nd St is a 2-bed, 1-bath home with 1,205 Sq.Ft. of living area, built in 1935. Based on nearby market data, the comp-implied value is approximately $209,993, compared with a baseline value of $191,728, indicating a modest premium supported by closely matched 2-bedroom sales comps. On the rental side, the comp-implied monthly rent is about $1,219 (baseline $1,289), consistent with the submarket's 2-bedroom median rent per Sq.Ft. of $1.09. The estimated gross rental yield is ~7.0% with a GRM of ~14.4. Market pace indicators show moderate sales velocity (27.6% of listings transact within 30 days) and faster leasing (54.6% within 30 days). Demographics and income are supportive, with median household income at $60,980, unemployment at 5%, and household growth projected to be positive.

The relationship between the comp-implied and baseline estimates suggests the subject's configuration aligns well with active 2-bedroom comparables, both in pricing per square foot and achievable rent per square foot. The rental market's median RPSF of $1.07 and the specific 2-bedroom segment median of $1.09 corroborate the income positioning. Meanwhile, the quicker rental absorption compared with for-sale turnover highlights a relative advantage for income stability, even as the sales market exhibits broader pricing dispersion across condition and vintage.

For investors, these figures indicate a balanced opportunity anchored by market-consistent pricing and rent with room for upside through condition-driven improvements. The moderate yield and GRM reflect an asset that can perform steadily in a healthy rental environment, while the sales side's longer marketing timelines and wide value dispersion underscore the importance of disciplined acquisition pricing and focused capital planning. Overall, the subject fits squarely into a well-defined 2-bedroom segment, with supportive demand drivers and manageable liquidity considerations.

Subject Property Overview

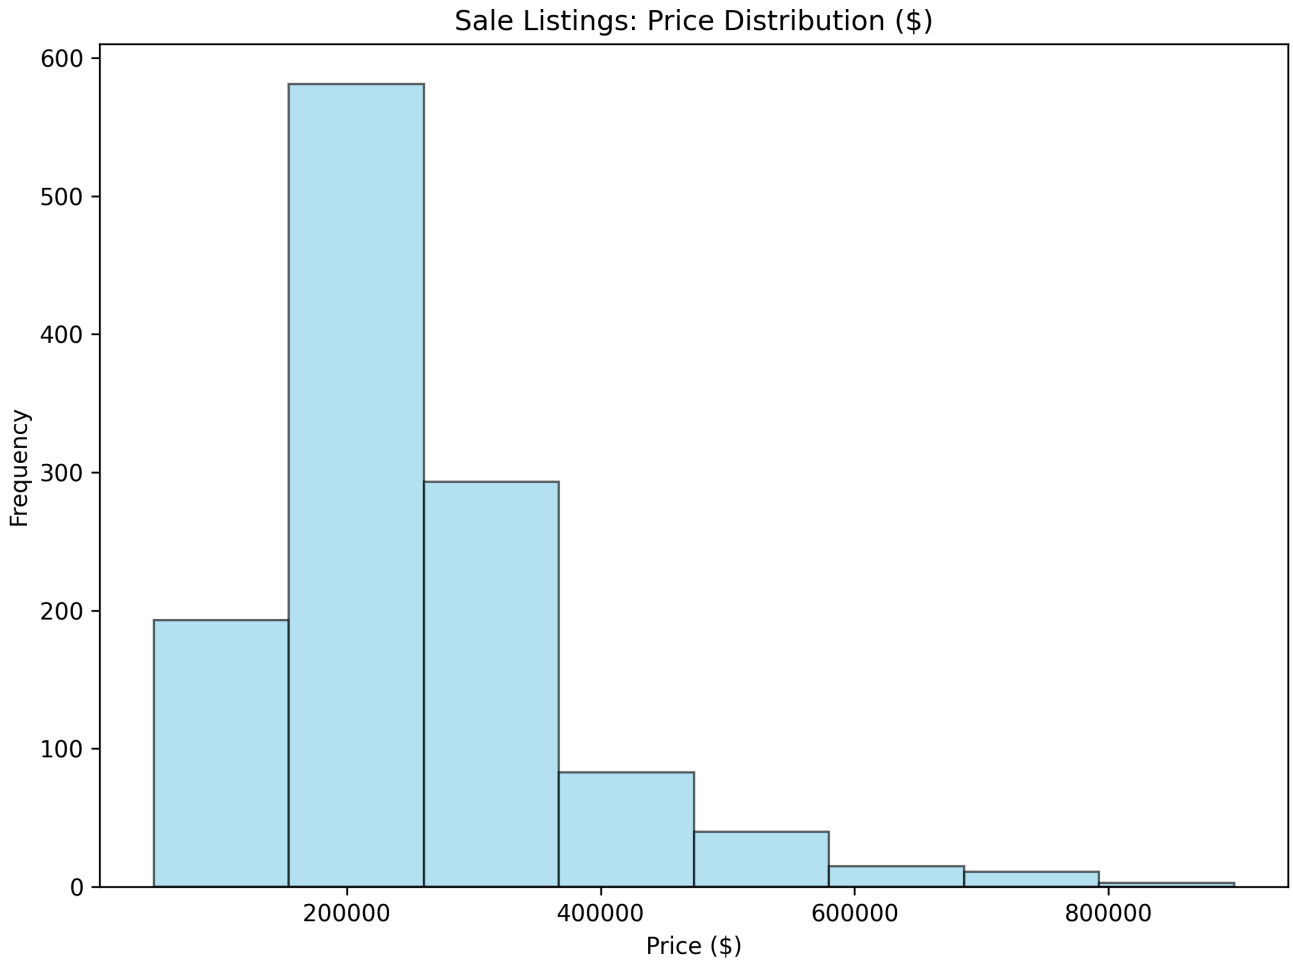
The property is located at 1824 Nw 32nd St and features 2 bedrooms, 1 bathroom, and 1,205 Sq.Ft. of living area on a 12,763 Sq.Ft. lot. It was built in 1935 and does not have an HOA fee reported. The last recorded sale was on 2019-10-02T00:00:00.000Z for $92,650. Current ownership is identified as Kimberly A Camp, with the owner type listed as Individual.

Given its 1935 vintage and modest footprint, the home's age points to typical considerations for older housing stock, such as maintenance, systems modernization, and finish updates. At 1,205 Sq.Ft., the property is smaller than the for-sale median living area of 1,463 Sq.Ft. but close to the rental median of 1,152 Sq.Ft., placing it competitively in the rental segment while remaining within the mainstream of comparable 2-bedroom sales.

These characteristics suggest a marketing strategy that emphasizes efficient layout and any recent updates to capture demand in the brisker rental market while pricing the asset competitively for sale within the 2-bedroom cohort. In both sales and rental contexts, targeted improvements to align with peer properties can support stronger pricing power, reduce time on market, and enhance income durability.

Sales Market Analysis

Sales Market Overview



The for-sale dataset includes 1,219 total listings, with a median price of $229,900. The median price per square foot (PPSF) is $159.11 and the average PPSF is $162.23, spanning a wide range from a minimum PPSF of $34.23 to a maximum of $721.15. Prices range from $48,000 to $899,000. Average living area is 1,556.16 Sq.Ft. (median 1,463 Sq.Ft.), with sizes running from 494 to 4,322 Sq.Ft. Marketing times are varied: average days on market (DOM) are 195.29, median DOM is 91, with a minimum of 1 and a maximum of 693. The price distribution is shown in the accompanying histogram.

The breadth in both absolute price and PPSF indicates notable dispersion, influenced by condition, finish level, and vintage. A median DOM of 91 days points to moderate turnover, with a long tail of listings that take substantially longer to transact. With the subject's 1,205 Sq.Ft. living area beneath the sales median, it sits within a segment where PPSF can be particularly sensitive to presentation and updates.

For the subject property, these conditions imply that positioning within the tighter middle of the PPSF range should help balance marketability and price realization. The moderate pace suggests adequate time for exposure and negotiation, while the visible dispersion underscores the need for accurate pricing aligned to condition. This environment supports an estimate anchored by well-matched comps rather than the broader market extremes.

Comparative Market Analysis (CMA)

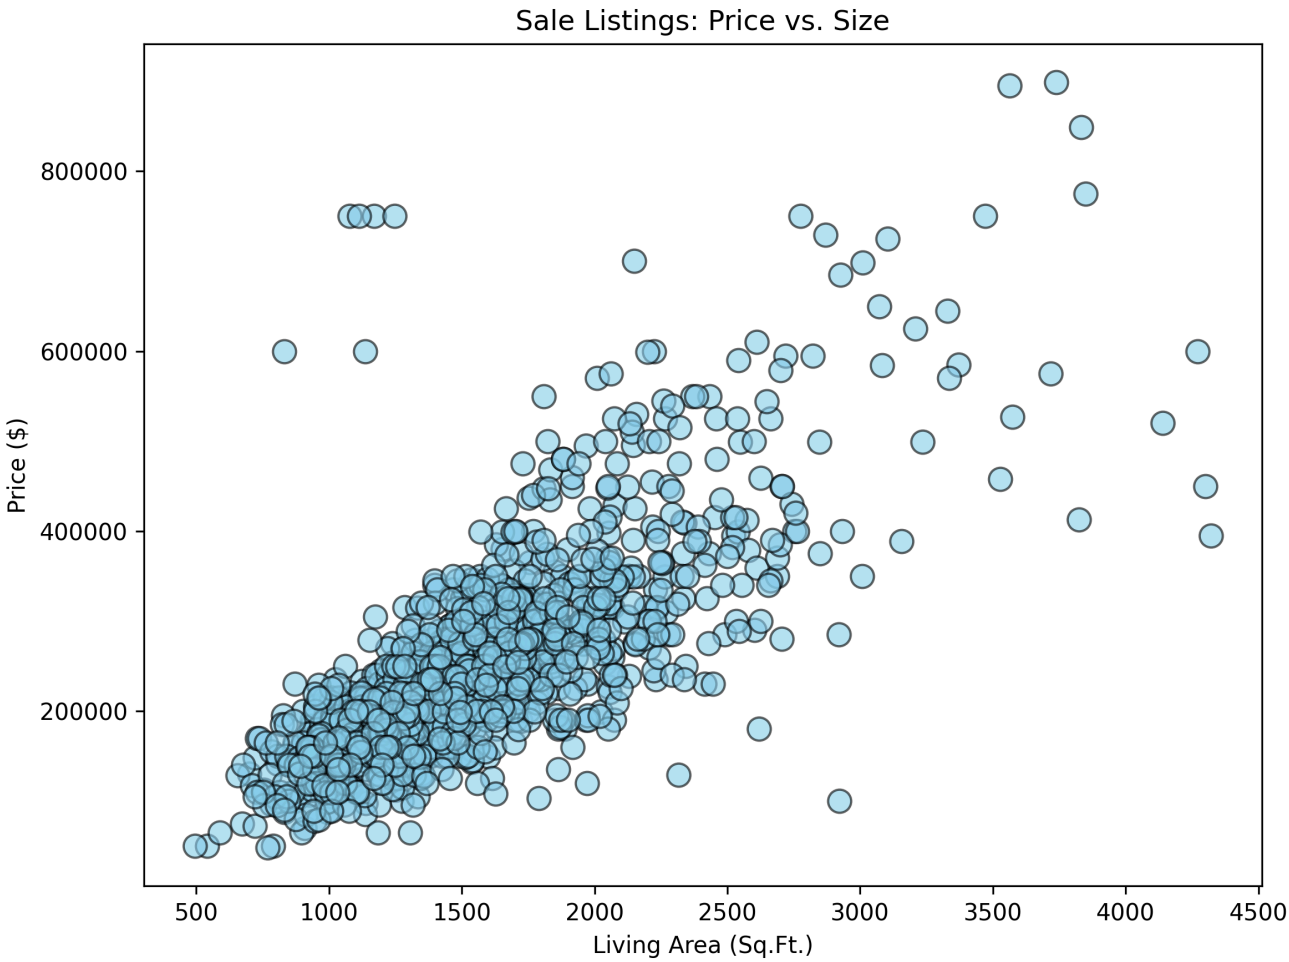
Address	Bedrooms	Bathrooms	Sq.Ft.	Vintage	Price	PPSF
2045 Nw 21st St	2.0	1.0	1204	1927.0	224900	186.79
2045 Nw 21st St	2.0	1.0	1204	1927.0	229900	190.95
1721 Nw 38th St	2.0	1.0	1203	1919.0	179500	149.21
1809 Nw 32nd St	2.0	1.0	1202	1950.0	199900	166.31
1617 Nw 43rd St	2.0	1.0	1199	1939.0	239777	199.98

The selected 2-bedroom comps are tightly aligned with the subject on beds, baths, size (1,199–1,204 Sq.Ft.), and era (1919–1950). PPSFs range from approximately $149.21 to $199.98, with transaction prices spanning $179,500 to $239,777. Two entries appear at the same address with slightly different prices and PPSF, indicating closely related market evidence around that specific property.

This set provides strong comparability, bracketing the subject's specifications and capturing the prevailing 2-bedroom pricing band. The lower-end PPSF reflects more modest finishes or condition, while the upper end approaches a near-$200 PPSF premium consistent with better-updated product. The duplicate address still offers corroboration for the segment, with both instances clustered near the upper-middle of the PPSF range.

Overall, the comps offer a reliable basis for valuation with limited need for heavy adjustments given their close alignment. Where adjustments are contemplated, they would likely focus on nuanced condition, micro-location, and finish differences rather than structural disparities in size or bedroom count.

Value Estimate



The baseline value, calculated as the submarket median PPSF applied to the subject's 1,205 Sq.Ft., is $191,728. Using the average PPSF of the selected comps, the comp-implied value for the subject is $209,993. The price-versus-size scatter plot provides a visual context for how the subject's size relates to observed pricing trends.

Comps aligned to the subject's configuration indicate a value near $210K, modestly above the baseline outcome. Given that the comparables are concentrated around similar sizes and vintages, their PPSF guidance is particularly relevant for the subject's positioning within the 2-bedroom cohort.

In practice, the comp-implied estimate serves as the more persuasive anchor for pricing and negotiations. The proximity of comp sizes and their clustering around the subject's profile lends confidence to a point estimate near $209,993 while acknowledging normal variation tied to condition and presentation.

Valuation Sensitivity

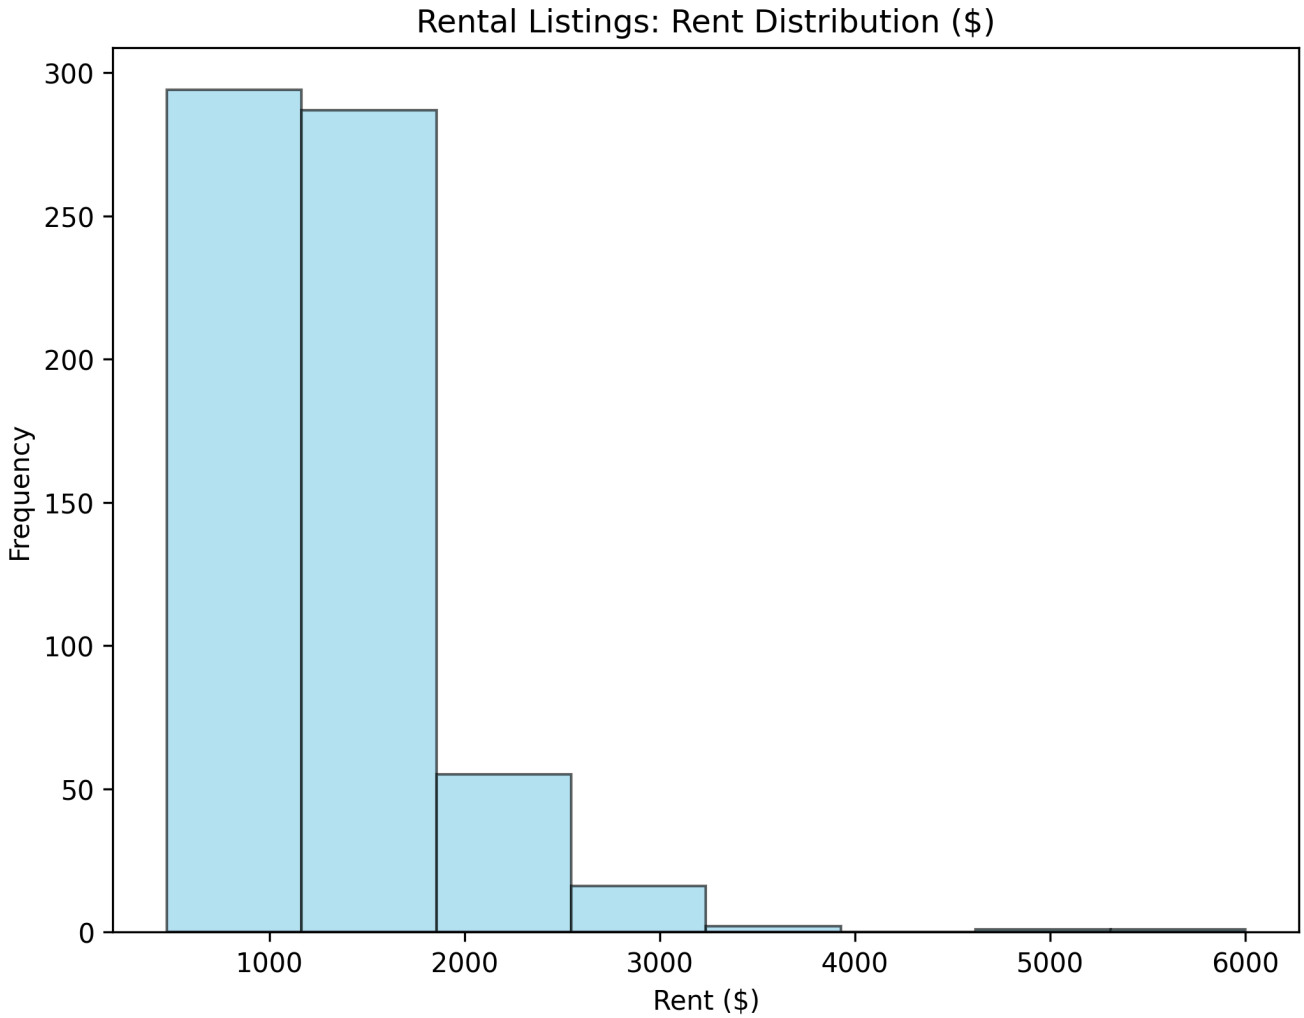
The selected value is $209,993. Applying the submarket's minimum PPSF to the subject's 1,205 Sq.Ft. yields a minimum estimated value of $41,247, while the maximum PPSF produces a maximum estimated value of $868,986. This spread reflects the full range observed in current listings rather than a likely operational band for the subject.

Such a wide sensitivity band highlights how extreme outliers—properties in distressed condition on the low end and premium, highly renovated assets on the high end—can influence PPSF statistics. The subject's 1935 vintage and typical 2-bedroom configuration make it more likely to fall within the mid-range suggested by the comps rather than the extremes.

For pricing strategy, this argues for setting expectations around the comp-implied value while maintaining flexibility for negotiation. Enhancing condition and finishes can help defend pricing toward the upper-middle of the comp band, whereas conservative assumptions should be used if marketing without upgrades.

Rental Market Analysis

Rental Market Overview



The rental dataset includes 656 listings, with a median rent of $1,200 and a median rent per square foot (RPSF) of $1.07 (average $1.078). Rents range from $475 to $6,000, and RPSF spans $0.23 to $2.07. Average living area is 1,270.86 Sq.Ft. (median 1,152 Sq.Ft.), covering a broad spectrum from 400 to 9,280 Sq.Ft. Rental marketing times are brisk relative to sales: average DOM is 90.59, median DOM is 21, with a minimum of 1 and a maximum of 1,379. The rent distribution is shown in the accompanying histogram.

Listings cluster around typical single-family sizes of 1,000–1,300 Sq.Ft., with RPSF medians indicating consistent pricing for mainstream product. The median DOM of 21 underscores healthy absorption and sustained renter demand. With a living area of 1,205 Sq.Ft., the subject sits within the most active size band.

This environment supports credible pricing power for a well-presented 2-bedroom, complemented by relatively quick lease-up times. Positioning near the segment's median RPSF should deliver solid occupancy, while targeted improvements can help capture higher RPSF within the validated range for comparable homes.

Comparative Market Analysis (CMA)

Address	Bedrooms	Bathrooms	Sq.Ft.	Vintage	Rent	RPSF
1628 Nw 36th St	2	1	1200.0	1924	1225	1.02
2321 N Youngs Blvd	2	1	1216.0	1928	1495	1.23
2036 Nw 31st Ter	2	1	1221.0	1940	1150	0.94
2412 Nw 38th St	2	1	1157.0	1960	1450	1.25

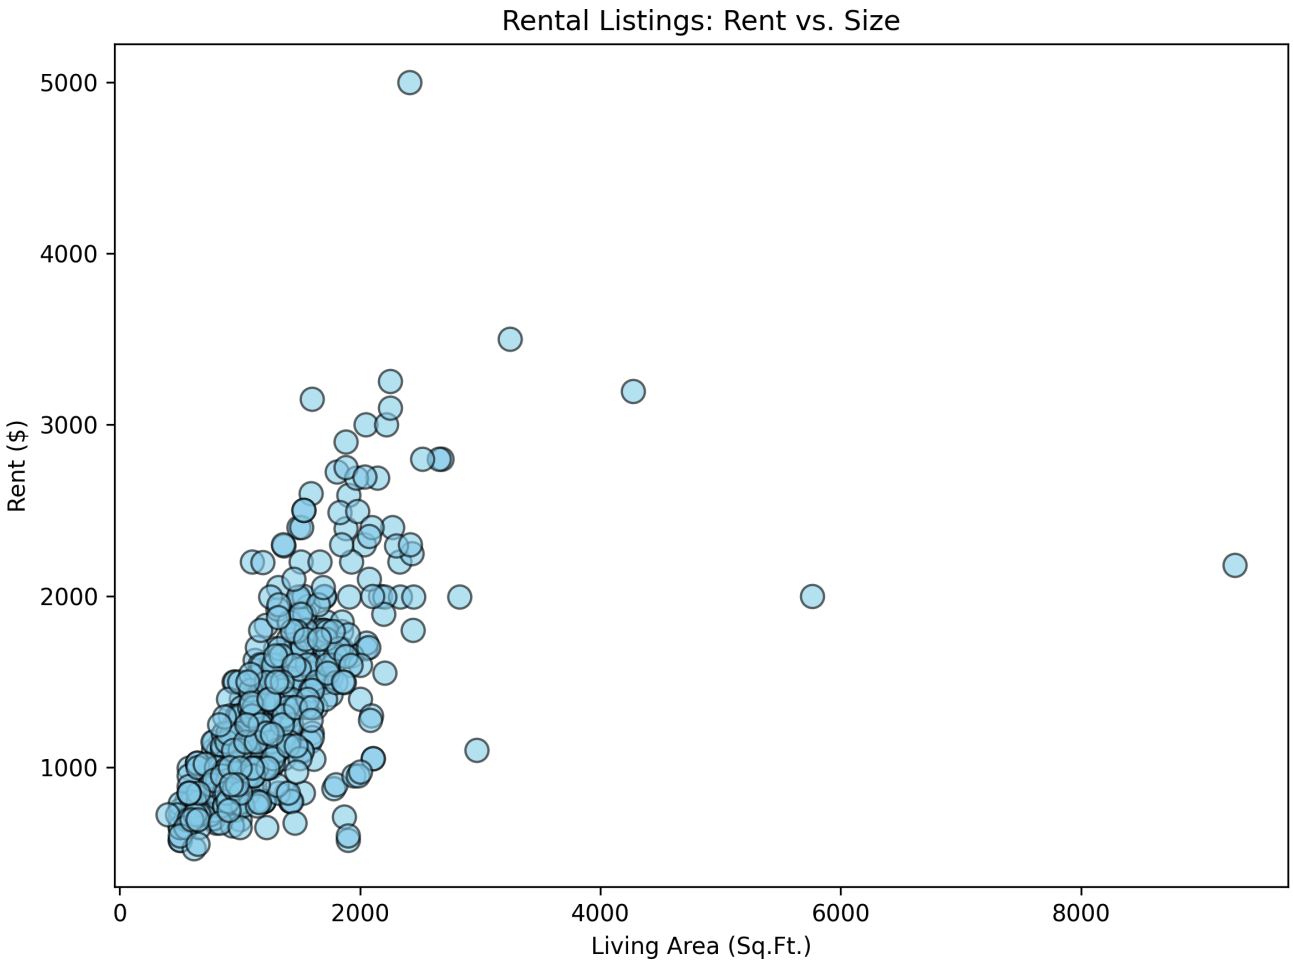
1700 Nw 21st St	2	1	1260.0	1930	1600	1.27

The rental comps are strongly aligned to the subject's profile: all are 2-bedroom, 1-bath homes between 1,157 and 1,260 Sq.Ft., built between 1924 and 1960. Asking rents span $1,150 to $1,600, with RPSFs between $0.94 and $1.27. This range encapsulates a representative spectrum of finishes and amenities for the segment.

Collectively, the comps validate the submarket's RPSF norms and illustrate how finish level and micro-location influence rent positioning. The upper tier, with RPSF around $1.25–$1.27, likely reflects more updated homes or superior locations, while the $0.94–$1.02 RPSF band aligns with more typical or modestly updated product.

For the subject, this dataset supports a rent strategy anchored near the low-$1,200s to mid-$1,400s, contingent on condition and presentation. It also provides a robust framework to justify pricing in line with prevailing market evidence during tenant negotiations.

Rent Estimate



The baseline rent, derived from the submarket median RPSF applied to 1,205 Sq.Ft., is $1,289. Using the average RPSF of the selected rental comps, the comp-implied rent is $1,219. The rent-versus-size scatter plot provides additional context on where the subject's size falls relative to observed rent patterns.

The comp-implied rent sits slightly below the baseline, but both outcomes are close, indicating alignment between general market medians and the specific 2-bedroom cohort. This proximity suggests that the subject's income potential is consistent with submarket

norms for a typical 2-bedroom of this size.

Given the tight alignment, the comp-based estimate offers a conservative but market-grounded target, while the baseline serves as a secondary reference point. Selection between the two may hinge on the property's current finish level and readiness; modest upgrades could help bridge the gap toward the baseline or beyond.

Rental Sensitivity

Minimum estimated rent, using the market's minimum RPSF, is $277, while the maximum estimated rent, using the market's maximum RPSF, is $2,494. These figures reflect the extremes of the submarket's observed RPSF range, rather than typical outcomes for a 2-bedroom home like the subject.

The span from $277 to $2,494 indicates the presence of both deeply discounted or atypical units and highly upgraded or premium offerings. For the subject's 1935 vintage and mainstream size, outcomes would ordinarily be expected within the mid-range validated by comps.

Operationally, pricing closer to the comp-validated range should balance occupancy and rent growth. Pushing toward the upper end requires investments in updates and amenities, while pricing below the baseline may accelerate absorption but at the expense of near-term income.

Market Dynamics and Segmentation

Market Velocity

Sales listings show average DOM of 195.29 and median DOM of 91, with a minimum of 1 and maximum of 693. Rental listings post average DOM of 90.59 and median DOM of 21, with a minimum of 1 and maximum of 1,379. The share of listings that transact within 30 days is 27.6% for sales and 54.6% for rentals.

This comparative view underscores stronger liquidity on the rental side, where more than half of listings lease within a month, versus roughly a quarter of sales closing that quickly. The sales market's long tail reflects greater negotiation, inspection, and financing variability.

For the subject, the implication is clearer rental timing and reduced carrying costs if held for income, contrasted with potentially longer exposure if pursuing a near-term sale. Strategy should account for this liquidity gap, especially when planning timeline, cash reserves, and exit flexibility.

Market Segmentation

Median sale PPSF by bedrooms is as follows: 1 BR at $110.91; 2 BR at $160.13; 3 BR at $159.14; 4 BR at $153.48; 5 BR at $163.20; and 6 BR at $147.45. Median rent RPSF by bedrooms is: 0 BR at $1.425; 1 BR at $1.135; 2 BR at $1.090; 3 BR at $1.065; 4 BR at $0.950; and 5 BR at $1.060. As a 2-bedroom with 1,205 Sq.Ft., the subject aligns with the 2-BR segment medians (sale ~$160.13 PPSF; rent ~$1.09 RPSF).

These segment medians indicate that 2-bedroom assets sit near the upper middle of sale PPSF and maintain solid rent RPSF relative to larger bedroom counts. The gentle step-downs in rent RPSF by bedroom suggest that smaller, well-located or well-finished units can command a premium per square foot.

Accordingly, the subject's 2-bedroom configuration should attract a broad pool of renters and buyers focused on value and efficiency. Marketing should highlight layout and any upgrades to differentiate within a well-defined segment where benchmarks are clear and comparable.

Demographic and Economic Analysis

Growth Trends

The area has a total population of 14,679 and 6,647 total households. Historical population growth from 2020–2025 is -0.07%, while household growth over the same period is 0.47%. Forecast growth rates for 2025–2030 are 0.22% for population and 0.37% for households.

The slight historical dip in population alongside positive household growth suggests household formation at smaller sizes or shifts in occupancy patterns. Forward-looking projections indicate a return to modest population growth with continued household expansion.

These dynamics point to stable housing demand, supporting both sale and rental absorption over time. For the subject, gradual household growth should help underpin occupancy and price resilience.

Economics and Affordability

Median household income stands at $60,980, with per capita income of $42,744. Future income growth (2025–2030) is projected at 2.13%. The unemployment rate is 5%. Educational attainment includes approximately 26.4% with a bachelor's degree and 18.1% with a graduate or professional degree.

Income and employment indicators are solid, with anticipated income growth providing additional support for affordability. The education profile complements these fundamentals, suggesting a stable and quality renter and buyer base.

For pricing and rent growth, these metrics imply scope for steady demand and competitive positioning without overreliance on aggressive appreciation. The subject can reasonably target market medians with confidence that purchasing power supports these levels.

Housing Occupancy

Occupancy is 84.1%, with a vacancy rate of 15.9%. This indicates meaningful available inventory within the submarket.

While vacancy is notable, it also implies that well-positioned properties—especially those updated and priced correctly—can outperform the broader market in absorption and retention. Competition will be sharper for units lacking upgrades or market-conforming finishes.

For the subject, emphasizing condition, curb appeal, and accurate pricing will be key to securing faster lease-ups and reducing turnover risk. Strategic improvements may yield outsized benefits in a market with discernible vacancy.

Investment Analysis

The subject's estimated value from sales comps is $209,993, and the estimated monthly rent from rental comps is $1,219. These inputs produce an approximate gross rental yield of ~6.97% (=$1,219 × 12 ÷ $209,993) and a gross rent multiplier of ~14.35 (=$209,993 ÷ [$1,219 × 12]).

A ~7% gross yield and ~14.4 GRM indicate a balanced return profile for a stabilized single-family rental in this submarket. The figures align with a market where rents are supported by solid incomes and leasing velocity, while sale prices reflect moderate turnover and a wide spread driven by condition differences.

From a strategy standpoint, value-add improvements that lift RPSF within the comp range can meaningfully enhance yield without overextending rent expectations. Risk management should focus on lease-up certainty and expense control, with acquisition pricing anchored to the comp-implied value.

SWOT Analysis

Strengths	Weaknesses	Opportunities	Threats
Strong rental velocity: 54.6% leased ≤30 days	Sales market lag: median DOM 91; average 195.3	Forecast household growth 0.37% and income growth 2.13% support demand	Wide PPSF dispersion makes value highly sensitive ($41K–$869K range)
Subject matches 2-BR segment medians (sale ~$160.13 PPSF; rent ~$1.09 RPSF)	Older housing stock (median year built 1936) may require capex	Comp-implied value ($210K) > baseline ($192K) indicates possible upside	Elevated vacancy (15.9%) suggests competitive leasing conditions
Solid local incomes ($60,980 median; 5% unemployment)	Historical population growth slightly negative (-0.07%)	Active pipeline across vintages (maxYearBuilt sale 2025; rent 2023)	High max DOMs (sale 693; rent 1,379) indicate potential time-on-market risk

The strengths center on rental market velocity, alignment with 2-bedroom segment medians, and solid local incomes and employment. Weaknesses reflect the older housing stock—implying potential capex—and slightly negative recent population growth. Opportunities include forecast household and income growth, as well as comp-implied value upside relative to the baseline. Threats involve wide PPSF dispersion, elevated vacancy, and the potential for extended time on market.

Taken together, the profile suggests an asset that can leverage its segment fit and local demand fundamentals to perform steadily, particularly on the rental side. The risks are manageable and largely tied to condition and competitive positioning—factors that can be addressed through targeted improvements and disciplined pricing.

Mitigation strategies include prioritizing value-add work that resonates with the 2-bedroom cohort, benchmarking rents to comp-validated levels, and maintaining acquisition discipline to buffer against market dispersion. On balance, strengths and opportunities appear to outweigh weaknesses and threats when the asset is properly positioned.

Conclusion and Recommendation

The subject is well-positioned within the 2-bedroom segment, with market-supported value

(~$210K) and rent (~$1,219/month). Rental velocity (54.6% leased within 30 days), solid household incomes ($60,980), and projected household growth provide a favorable backdrop, while sales liquidity remains moderate. The resulting ~7% gross yield and ~14.4 GRM frame a balanced, income-oriented profile.

The outlook is supported by a cohesive story across segments: comparable sales tightly match the subject, rental comps validate achievable RPSF, and demographic trends indicate steady demand. Residual uncertainties stem from the market's broad PPSF dispersion and the submarket's vacancy, both of which heighten the importance of condition and pricing discipline.

Recommendation: Proceed with acquisition at or below the comp-implied value, and prioritize light-to-moderate updates to target the upper-quartile RPSF within the 2-bedroom set. Leverage the submarket's strong rental absorption to stabilize quickly, using comp-validated pricing to balance occupancy and income growth.
