Property Submarket Analysis Report

Executive Summary

The subject property at 15044 87th Rd is a 5-bedroom, 4-bathroom home offering 1,836 Sq.Ft. of living area, built in 1925. The local for-sale market currently includes 448 active listings with a median price of $1,149,000 and a median price per Sq.Ft. of $519.13; median days on market (DOM) is 72. On the rental side, there are 90 listings with a median rent of $3,000, a median rent per Sq.Ft. of $2.635, and a median DOM of 32. Using sales comparables most aligned with the subject, the comp-implied value is approximately $1,050,181 versus a baseline of $953,123, with a min–max sensitivity range of roughly $306,667 to $3,026,371. For rentals, the comp-implied rent is about $5,967/month versus a baseline of $4,838/month, with a sensitivity band spanning $1,377 to $8,042/month.

Taken together, these figures indicate an active submarket with steady sales turnover and quicker rental absorption. The subject's configuration and size position it close to relevant 5-bedroom comparables, which tend to support stronger-than-median price per Sq.Ft. and rent per Sq.Ft. outcomes. While price per Sq.Ft. dispersion is wide in the sales market, the tighter clustering among the top rental comps suggests a path to above-median rent performance for a well-positioned home of this size.

From an investment perspective, the implied gross rental yield is approximately 6.82% and the gross rent multiplier (GRM) is about 14.67, indicating moderate income strength in a liquid rental environment. The breadth of value and rent sensitivity underscores the importance of condition, finish level, and marketing strategy. Within these parameters, the subject compares favorably to typical listings by bedroom count, offering a viable opportunity to capture income while maintaining optionality in an active for-sale market.

Subject Property Overview

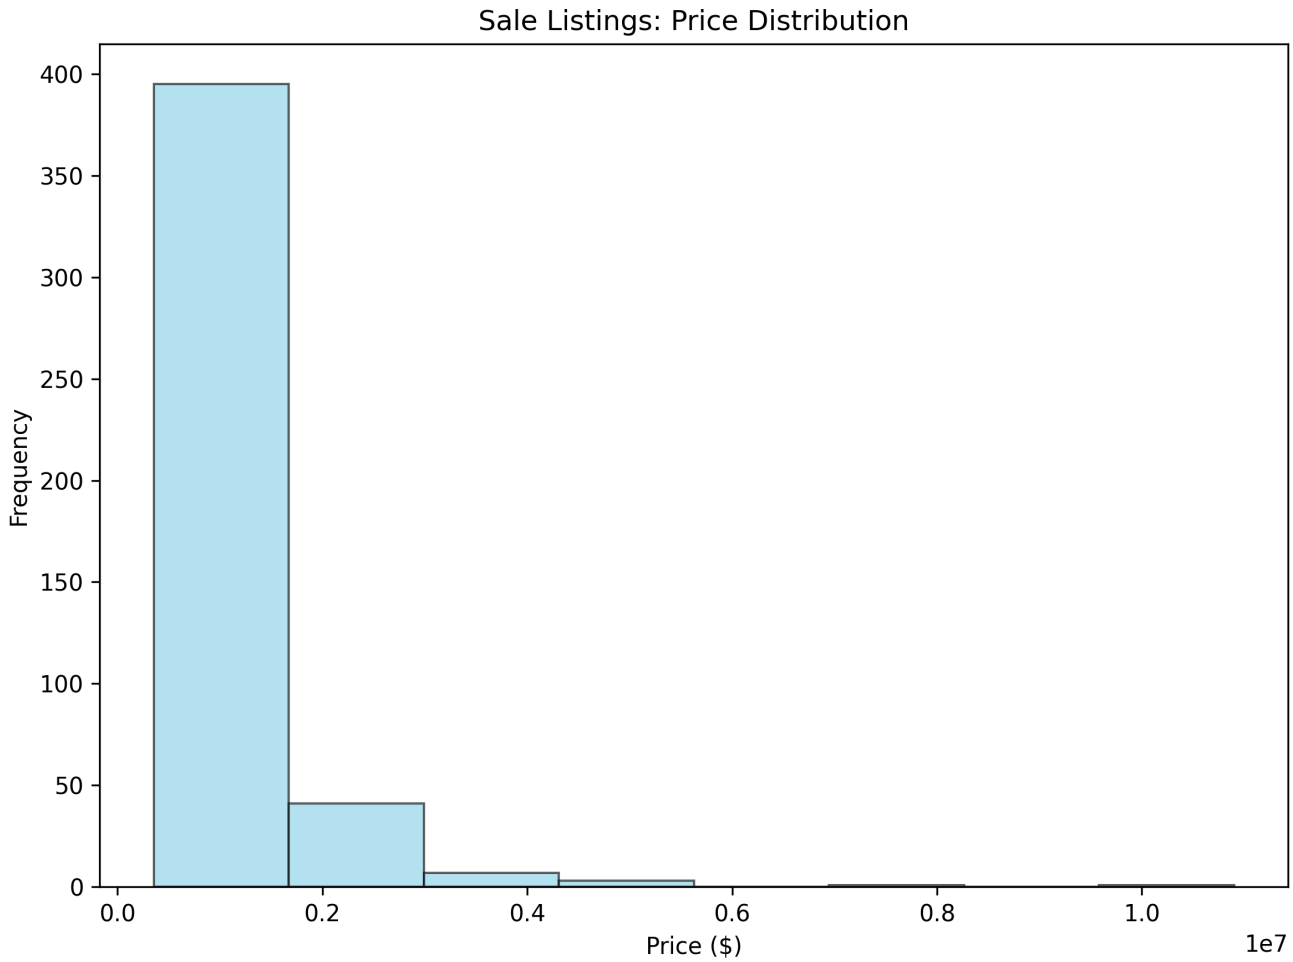
The property at 15044 87th Rd features 5 bedrooms and 4 bathrooms across 1,836 Sq.Ft. of living area on a 4,033 Sq.Ft. lot. Built in 1925, it does not carry an HOA fee (N/A). The most recent sale occurred on 2016-11-07 for $694,000. Ownership is recorded to [Dong Han, Weida Chen] as Individuals. The home's scale and bedroom count align with family-oriented demand segments, particularly in submarkets where larger single-family residences are relatively scarce.

Given its 1925 vintage, the property may present a range of condition scenarios—from preserved period features to areas requiring modernization. At 1,836 Sq.Ft., the home is smaller than the current sales median living area of 2,196 Sq.Ft., placing it slightly below the size midpoint for active inventory while still offering five bedrooms. This size-to-bedroom ratio can be advantageous if the floor plan is efficient, particularly for rental positioning where bedroom count is often a key driver of demand.

These characteristics suggest a balanced approach to pricing and marketing. On the sales side, positioning near comp-supported values will be important to offset broader market dispersion by price per Sq.Ft. In rentals, the five-bedroom configuration may command a premium over the market median rent and support faster leasing, especially if recent updates and thoughtful presentation minimize any perceived age-related drawbacks.

Sales Market Analysis

Sales Market Overview



Across 448 listings, the median price is $1,149,000 and the median price per Sq.Ft. is $519.13. The average price per Sq.Ft. is $546.420476, with prices spanning from a minimum of $354,900 to a maximum of $10,900,000. Price per Sq.Ft. ranges from $167.03 to $1,648.35. The median living area is 2,196.0 Sq.Ft. (average 2,568.571429), with the smallest home at 1,100.0 Sq.Ft. and the largest at 27,252.0 Sq.Ft. Time on market averages 109.002232 days, with a median of 72.0 days, and a range from 1 to 736 days.

The histogram reflects a broad distribution by both price and size, indicating a heterogeneous inventory that includes older and newer stock as well as varied property types. The substantial spread in price per Sq.Ft.—from $167.03 up to $1,648.35—signals substantial segmentation and differing conditions, quality levels, and locations within the one-mile radius. The median DOM of 72.0 days points to steady turnover, even as outliers extend the average higher.

For the subject, this environment implies that precise positioning by condition and quality is critical. Given the subject's sub-median size but five-bedroom configuration, a focus on the comp set most similar in layout and finish is likely to yield more reliable pricing guidance than market-wide medians alone. The median DOM suggests that well-priced listings can move within a reasonable timeframe, while premium pricing in the higher PPSF tiers will require standout condition or features to avoid extended marketing periods.

Comparative Market Analysis (CMA)

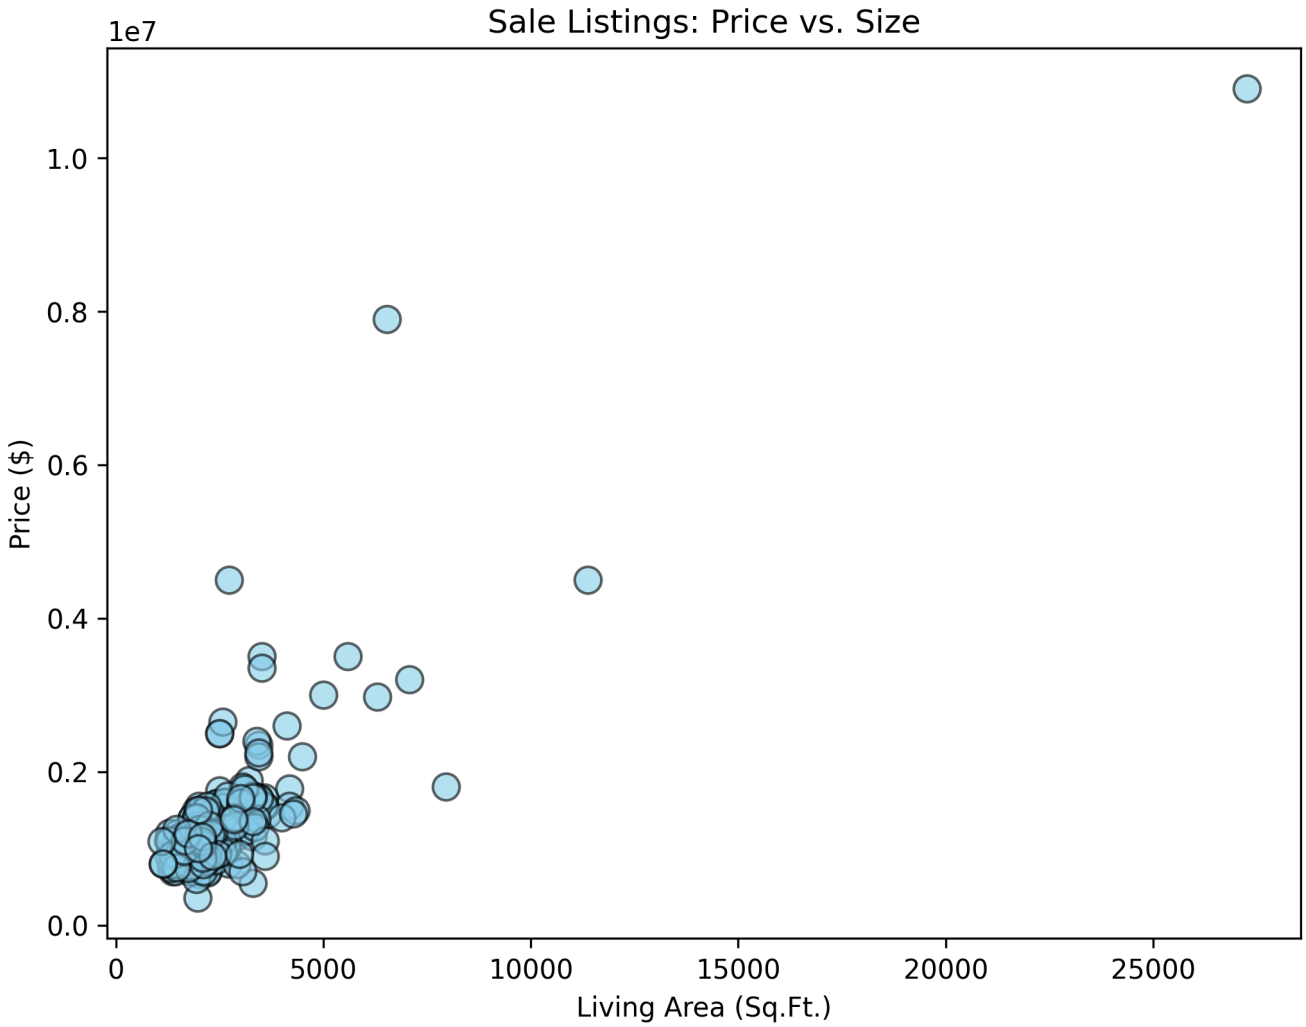
addressLine1	bedrooms	bathrooms	squareFootage	yearBuilt	price	pricePerSquareFoo
15044 87th Rd	5.0	4.0	1836.0	1925.0	1250000	680.83
14321 84th Rd	5.0	4.0	1936.0	2005.0	1400000	723.14
14321 84th Rd	5.0	4.0	1936.0	2005.0	1400000	723.14
150-39 Yates Rd	5.0	4.0	2100.0	1993.0	876000	417.14
13039 92nd Ave	5.0	4.0	2214.0	1920.0	699000	315.72

The selected comps concentrate on five-bedroom, four-bath homes with living areas from 1,836.0 to 2,214.0 Sq.Ft. and construction years spanning 1920.0 to 2005.0. Price per Sq.Ft. across this group ranges from $315.72 to $723.14. Notably, one property appears as a duplicate at 14321 84th Rd, reflecting the available dataset and reducing diversity within the immediate comp set.

Relative to the subject's 1,836.0 Sq.Ft. and 1925.0 build, the comps bracket both size and age, with one higher-priced, newer home at 2005.0 and others that are older but larger. The subject's own $680.83 per Sq.Ft. reference within this table aligns more closely with the upper portion of the comp range, suggesting that finish or location advantages may be present among higher-priced analogues. The lower-PPSF comps, particularly those with larger footprints or older vintages, may reflect condition or location factors that are less comparable to the subject's positioning.

Overall reliability is reasonable for establishing a pricing corridor, though the duplicate entry and the range in age/condition imply that adjustments for renovation level, mechanical systems, and amenities could be necessary. Emphasis should be placed on comps with the closest alignment in effective condition and recent updates to refine the estimate within the observed $315.72–$723.14 PPSF band.

Value Estimate



The baseline value using the market median price per Sq.Ft. of $519.13 applied to 1,836 Sq.Ft. is $953,123. The comp-implied value, based on the average price per Sq.Ft. of the selected comps applied to the same size, is approximately $1,050,181. These two anchors frame the subject's likely positioning in the current market given its size and configuration.

Interpreting the price-versus-size relationship shown in the scatter plot, the subject's 1,836 Sq.Ft. footprint is below the market's median living area of 2,196.0 Sq.Ft., which can concentrate values in a higher PPSF range if condition and layout are competitive. The comp-implied figure exceeding the baseline suggests that the most similar properties in the area transact at a premium to the market-wide median, likely reflecting five-bedroom demand and comparable upgrade profiles.

Confidence in the estimate is moderated by the submarket's wide PPSF dispersion. However, the subject's alignment with a relatively cohesive comp cluster supports leaning toward the comp-implied value of roughly $1.05M. Final pricing should still account for property-specific condition, finishes, and block-level factors that can swing outcomes within the observed range.

Valuation Sensitivity

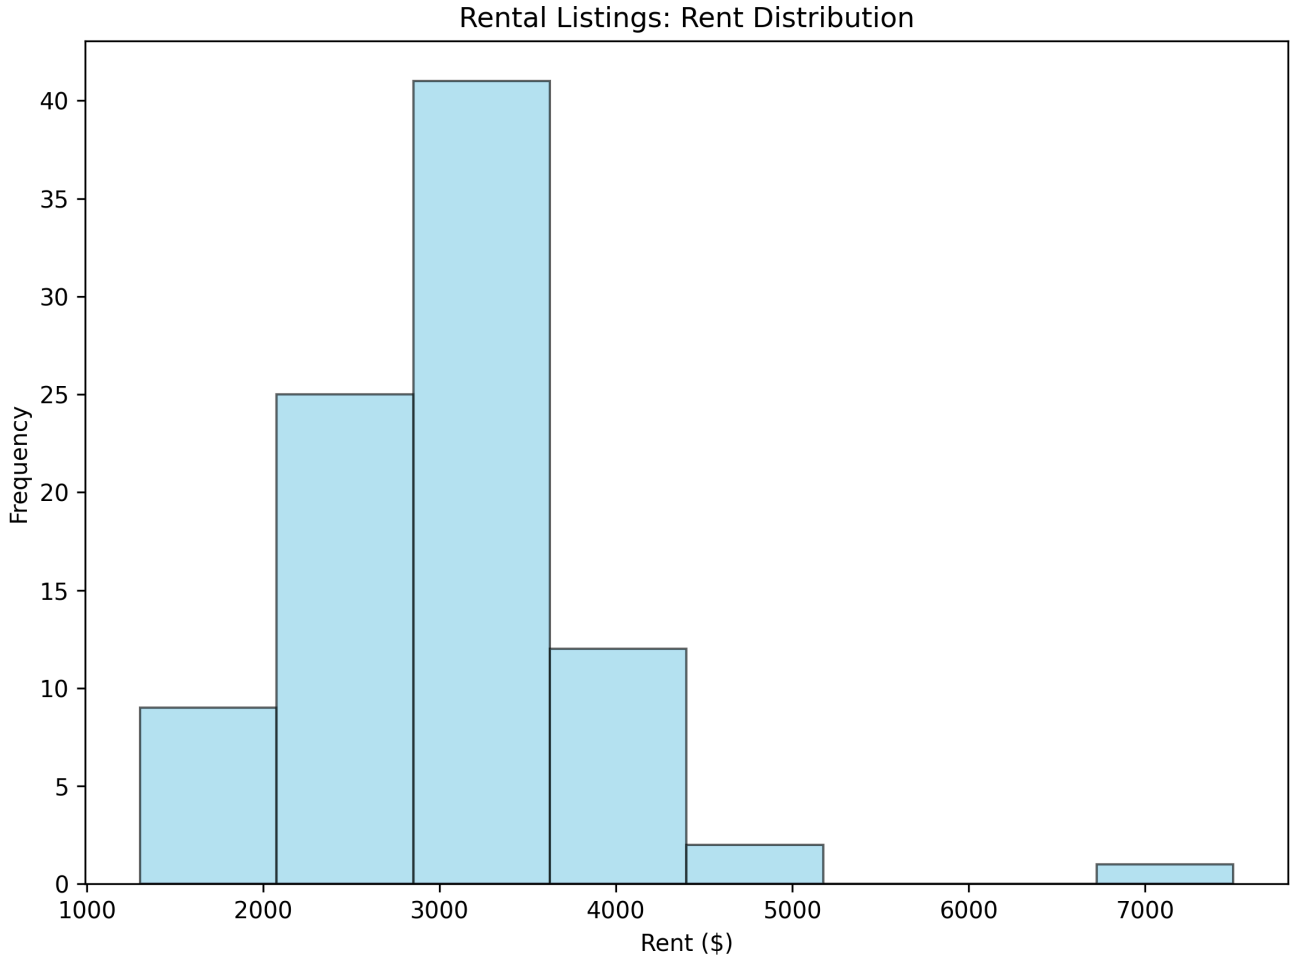
The selected estimate centers on the comp-implied value of $1,050,181. Applying the submarket's minimum observed price per Sq.Ft. to the subject's size yields a minimum estimated value of $306,667, while the maximum price per Sq.Ft. implies a potential value up to $3,026,371. This wide band reflects the diversity of stock captured in the dataset.

At the low end, outcomes are consistent with dated condition, functional limitations, or less favorable micro-locations. The high end points to best-in-class renovations or unique property attributes commanding exceptional PPSF. Given the subject's five-bedroom configuration and alignment with comparable sales near the upper mid-range, a position closer to the comp-implied center appears most defensible.

For strategy, this range encourages a two-step approach: test comp-supported pricing near $1.05M, while remaining attentive to feedback and days on market to calibrate quickly if necessary. The breadth of the theoretical ceiling suggests that targeted enhancements—particularly in kitchens, baths, and curb appeal—could justify firmer pricing if the current condition does not already match higher-tier comparables.

Rental Market Analysis

Rental Market Overview



The rental market comprises 90 listings with a median rent of $3,000 and a median rent per Sq.Ft. of $2.635. The average rent per Sq.Ft. is 2.722414, with minimum and maximum rents of $1,300 and $7,500, respectively. Rent per Sq.Ft. spans 0.75 to 4.38. The median living area is 1,132.0 Sq.Ft. (average 1213.344827586207), ranging from 680.0 to 2,500.0 Sq.Ft. Median days on market are 32.0 (average 63.941176), with a range from 2.0 to 542.0 days.

The distribution shows meaningful clustering by size, with many rentals around 1,000–1,200 Sq.Ft., and a wide rent-per-Sq.Ft. spread that reflects varied unit types, amenities, and condition levels. The relatively quick median leasing time of 32.0 days suggests healthy demand and responsive pricing. Outliers with extended DOM likely reflect mispricing or

atypical property attributes.

For the subject, which is larger than typical rentals and offers five bedrooms, the market's breadth provides room to target upper-tier rent-per-Sq.Ft. if condition, layout, and presentation align. Faster rental velocity supports a strategy focused on minimizing vacancy through precise pricing and targeted marketing, especially given the segment's demonstrated absorption.

Comparative Market Analysis (CMA)

addressLine1	bedrooms	bathrooms	squareFootage	yearBuilt	rent	rentPerSquareFoot
15814 82nd Dr	4	2.5	1200.0	1930.0	4000	3.33
84-63 161 St	4	2.0	2000.0	1930.0	3700	1.85
150-64 86 Ave	4	2.0	1200.0	1920.0	4500	3.75
170-34 93rd Ave	4	2.0	1114.0	2007.0	4111	3.69
170-34 93rd Ave	4	2.0	1114.0	2007.0	4070	3.65

The closest rental comps include five properties with four bedrooms, ranging from 1,114.0 to 2,000.0 Sq.Ft., built between 1920.0 and 2007.0, and asking rents from $3,700 to $4,500 per month where provided. Rent per Sq.Ft. across these comps ranges from 1.85 to 3.75, clustering in the low-to-mid $3/Sq.Ft. tier for smaller homes and nearer to $2/Sq.Ft. for the 2,000.0 Sq.Ft. example. One address appears twice, reflecting dataset availability.

Compared to the subject's five-bedroom, 1,836 Sq.Ft. profile, these comps are slightly smaller on average and one bedroom shy. The higher RPSF seen among the 1,114.0–1,200.0 Sq.Ft. homes suggests a size premium at smaller footprints, whereas the 2,000.0 Sq.Ft. comp illustrates typical RPSF compression at larger sizes. The subject's additional bedroom may help offset this compression, supporting a rent level above the median baseline if the property's condition and layout are competitive.

While the comp group lacks true five-bedroom rentals, it offers relevant guidance on achievable RPSF in adjacent size bands. Adjustments for the subject's larger size and extra bedroom are warranted, and the concentration of comps in the $3+ per Sq.Ft. range suggests a reasonable pathway to above-median rents, subject to property quality and tenant appeal.

Rent Estimate

The baseline rent estimate, applying the median rent per Sq.Ft. of $2.635 to 1,836 Sq.Ft., is $4,837.86 per month. Using the average rent per Sq.Ft. of the selected comps yields a comp-implied rent of $5,967.00 per month. These two anchors frame a reasonable expectation for the subject's monthly rent.

Positioning the subject on the rent-versus-size scatter, its larger footprint relative to the median rental (1,132.0 Sq.Ft.) implies a lower RPSF than the smallest units but a higher absolute rent, particularly with five bedrooms. The comp-implied estimate above the baseline suggests that bedroom count and the comp cluster's RPSF support an upper-tier outcome for the subject's size.

In practice, the comp-based estimate appears more representative for a five-bedroom single-family rental in this area, provided the home's condition and amenities resonate with tenant expectations. The baseline remains a useful downside reference if market feedback indicates resistance at the higher comp-anchored pricing.

Rental Sensitivity

Applying the submarket's minimum and maximum rent per Sq.Ft. to the subject's size produces a range from $1,377.00 to $8,041.68 per month. This range captures conditions from discounted, lower-quality offerings to best-in-class properties securing premium rates. It also reflects seasonal or tactical pricing dynamics that can materially affect absorption.

In softer demand windows or with deferred maintenance, outcomes may gravitate toward the lower half of the range. Conversely, recently updated properties marketed during peak leasing periods and offering strong bedroom-to-bath ratios can justify rents toward the upper

tiers of the comp-anchored band, though the absolute market maximum remains a high bar.

Balancing price against occupancy, a strategy that targets the comp-implied level near $5,967.00 with readiness to pivot based on leasing velocity can mitigate vacancy risk while pursuing upside. This approach aids cash flow planning by anchoring to a realistic top-quartile target and retaining flexibility in response to tenant demand signals.

Market Dynamics and Segmentation

Market Velocity

Sales listings show an average DOM of 109.00 and a median of 72, with a range from 1 to 736 days. Rentals exhibit an average DOM of 63.94 and a median of 32, spanning 2 to 542 days. The share of listings transacting within 30 days is 0.3214 for sales and 0.4444 for rentals, indicating faster turnover in the rental market.

This disparity points to stronger near-term liquidity on the rental side, where nearly half of listings lease within roughly a month. Sales velocity remains steady but more variable, with notable tails reflecting pricing, condition, or property type differences. The rental market's relative speed aligns with observed RPSF segmentation and tenant demand for well-located, functional homes.

For the subject, these dynamics imply that a rental strategy can capture income quickly if appropriately priced and presented. On the sales side, expectation setting around a 72-day median timeline is prudent, with faster outcomes possible if pricing is supported by recent comps and the home shows well. Holding cost considerations should align with this velocity profile.

Market Segmentation

By bedroom count, the median sale price per Sq.Ft. is $488.505 for 4-bedroom homes and $513.800 for 5-bedroom homes, compared with an overall median PPSF of $519.13. On the rental side, median rent per Sq.Ft. is $3.315 for 4-bedroom homes, while 5-bedroom rental medians are N/A due to insufficient data. The subject is a 5-bedroom, 1,836 Sq.Ft. home, compared to the 2,196 Sq.Ft. sales median.

This segmentation suggests that, on the sales side, five-bedroom homes command a modest PPSF premium over four-bedroom homes, though slightly below the overall median. For rentals, the absence of a five-bedroom median necessitates reliance on adjacent segments and comp-based inferences, where four-bedroom RPSF provides a proxy that likely understates five-bedroom potential for larger homes.

In practice, marketing should emphasize the subject's five-bedroom utility and competitive PPSF positioning, especially given its slightly smaller footprint relative to median sold sizes. Rental pricing can reference the four-bedroom RPSF while accounting for the added bedroom, with targeted messaging to larger households seeking value in total rent rather than RPSF alone.

Demographic and Economic Analysis

Growth Trends

The local area includes a total population of 112,208 and 37,922 households. Historical growth from 2020–2025 shows a population change of -0.03% and household growth of 0.49%. Forecasts for 2025–2030 project population growth at 0.85% and household growth at 1.12%.

Recent trends indicate near-flat population movement with modest household formation, transitioning to a forecast of renewed growth, particularly for households. This pattern typically supports incremental housing demand as new households form, even when overall population growth is moderate.

For the subject property, projected household gains are supportive of both sales and rental demand over the medium term. Anticipated growth can underpin pricing resilience and absorption, improving confidence in income sustainability and potential exit scenarios.

Economics and Affordability

Median household income stands at $72,316, with per capita income at $32,647. Future income growth (2025–2030) is projected at 2.02% annually. The unemployment rate is 6.5%. Educational attainment includes a bachelor's degree share of 0.2174 and a graduate/professional degree share of 0.1244.

These indicators point to moderate purchasing power with steady income growth expectations and a meaningful base of higher-education attainment. The 6.5% unemployment rate signals some labor market slack relative to tighter environments, which can influence absorption and pricing sensitivity at higher tiers.

For the subject, this economic profile suggests a balanced demand environment: sufficient income to support mid-to-upper-tier rents for larger homes, but with a need to ensure value relative to alternatives. Thoughtful pricing and presentation that emphasize functionality and condition will help capture the segment of renters and buyers aligned with these income and education levels.

Housing Occupancy

Housing occupancy is reported at 0.9192, with a vacancy rate of 0.0808. This indicates strong utilization of the local housing stock, while still allowing room for tenant mobility and selection.

A vacancy rate near this level generally supports rent stability, as supply is not excessively slack. It also provides a cushion for landlords to adjust pricing without significant risk of prolonged vacancies, provided properties are competitively positioned.

For investors in the subject property, the occupancy profile supports income consistency and manageable turnover. This underpins confidence in achieving the comp-implied rent target, with the flexibility to adapt pricing to maintain high occupancy and minimize downtime.

Investment Analysis

The comp-implied value is $1,050,181 and the comp-implied monthly rent is $5,967. At these figures, the gross rental yield (annual rent ÷ value) is approximately 6.82%, and the gross rent multiplier (value ÷ annual rent) is about 14.67. These indicators place the asset in a moderate yield bracket relative to typical single-family rentals.

This yield/GRM profile, combined with faster rental velocity and high occupancy, points to solid income potential with reasonable liquidity. The broader sensitivity ranges for both value and rent reflect submarket dispersion by condition and product type, which should be considered when setting expectations and capital plans.

Overall, the subject can deliver competitive income if aligned to the comp-supported rent level and maintained to reflect tenant preferences. Execution—upgrades, marketing, and pricing discipline—will be the primary drivers of realized yield within the established range.

SWOT Analysis

Strengths	Weaknesses	Opportunities	Threats
High occupancy rate of 91.92% supports stable demand	Rental data for 5-bed units is limited (median RPSF N/A)	Forecast household growth of 1.12% annually (2025–2030)	Wide PPSF range ($167–$1,648) creates valuation uncertainty
Rental market turns quickly (median 32 DOM)	Sales market slower (median 72 DOM), potential carrying costs	Comp-implied rent of ~$5,967 exceeds baseline ($4,838)	Unemployment at 6.5% may constrain some renter segments
Subject aligns with nearby 5-bed comps, comp-implied value ~$1.05M	Property smaller than sales median size (1,836 vs. 2,196 Sq.Ft.)	Income projected to grow 2.02% annually (2025–2030)	Rent outcomes vary widely ($0.75–$4.38/ Sq.Ft.)

The strengths center on healthy occupancy, brisk rental absorption, and the subject's alignment with five-bedroom comparables that support a comp-implied value around $1.05M. Weaknesses include limited five-bedroom rental medians, slower sales velocity than rentals, and the subject's size being below the sales median, which can influence buyer perceptions of value.

Opportunities arise from projected household growth and income gains, as well as the ability to capture rents above the baseline given comp performance. Threats include valuation uncertainty stemming from the wide PPSF range, labor market slack at 6.5% unemployment, and broad RPSF dispersion that can widen leasing outcomes based on condition and timing.

Mitigation strategies include anchoring to the comp-implied rent and value while prioritizing upgrades with the highest tenant and buyer impact. Maintaining pricing flexibility, monitoring DOM, and adjusting quickly to market feedback will help convert strengths into realized performance and buffer against the highlighted risks.

Conclusion and Recommendation

The subject's comp-implied value is approximately $1,050,181, with a comp-implied rent near $5,967 per month. At these levels, the gross rental yield is about 6.82% and the GRM is roughly 14.67. The rental market's median DOM of 32, alongside an occupancy rate of 0.9192 and projected household and income growth, provides a supportive backdrop for income stability.

Market indicators—faster rental velocity relative to sales, steady sales turnover around a 72-day median, and segmentation that favors five-bedroom configurations—reinforce the outlook. While limited five-bedroom rental medians and a wide PPSF range introduce

uncertainty, the comp sets create a credible valuation and rent corridor anchored near $1.05M and approximately $6,000 per month.

We recommend proceeding with an acquisition or hold strategy guided by the comp-implied value and rent. Prioritize condition alignment with top-quartile comps to capture rents near $6,000/month, and maintain pricing agility to protect occupancy. With disciplined execution, the property presents a compelling, moderately yielding income asset in a relatively active submarket.
