# Property Submarket Analysis Report

## Executive Summary

The subject property at 44 Croteau Ct is a 5-bedroom, 2-bath home with 1,196 Sq.Ft. of living area, built in 1972. In the 1-mile sales market, there are 16 active listings with a median price of $529,000 and a median price per Sq.Ft. of $172.97; the median days on market is 22. Using the median price per Sq.Ft., the baseline value is approximately $206,866, while the top five sales comps imply a value of approximately $267,385. On the rental side, 19 active listings show a median rent of $2,720 and a median rent per Sq.Ft. of $2.57; the baseline rent estimate is $3,073.72 per month and the comp-implied rent is $3,183.75 per month.

These figures show a sales market with brisk turnover and a wide value distribution, contrasted by a rental market with slower velocity but tighter clustering around mid-$2,000s monthly rents. The subject is considerably smaller than the typical sales listing, reinforcing the use of price-per-square-foot and rent-per-square-foot approaches. Sensitivity bands frame the value between $171,733.64 and $347,354.28 and the rent between $1,506.96 and $3,324.88, indicating meaningful dispersion tied to condition and positioning.

From an investment perspective, the comp-implied figures translate to a gross rental yield of about 14.29% and a gross rent multiplier near 7, supported by high occupancy (97.60%) and strong incomes (median household income $104,238). While rental velocity is slower than sales, the income profile and occupancy rate support demand and cash-flow resilience. Overall, the subject compares favorably to typical listings on a yield basis, with upside if condition and marketing can capture the upper end of the rent range.

## Subject Property Overview

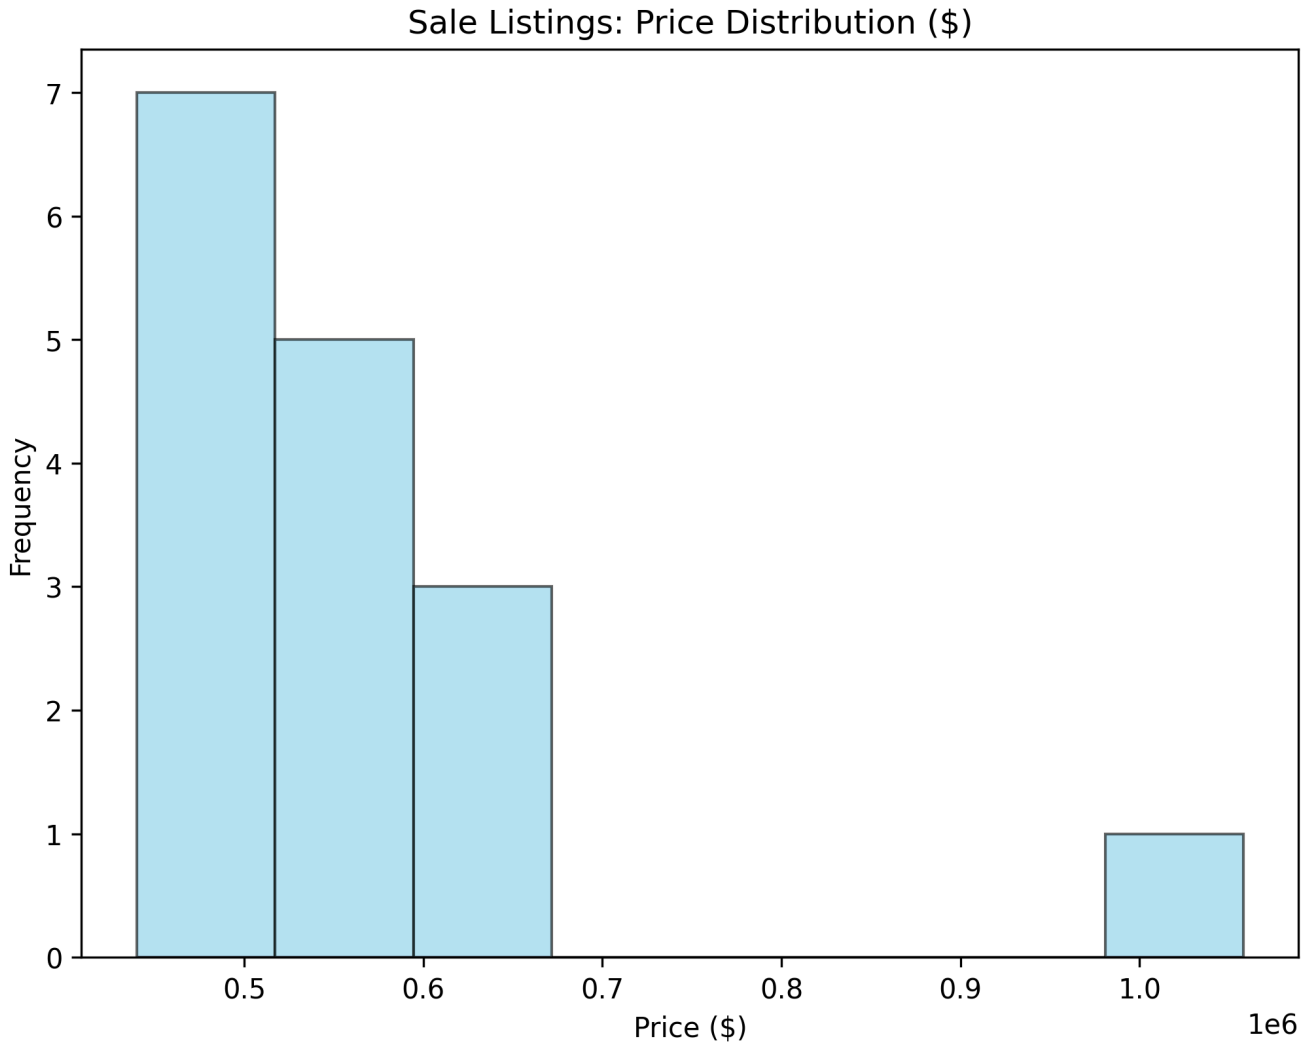
The property is located at 44 Croteau Ct and features 5 bedrooms, 2 bathrooms, and 1,196 Sq.Ft. of living area on a 7,404 Sq.Ft. lot. It was built in 1972, has no stated HOA fee, and last sold on 2021-12-10 for 15500000. The owner of record is 44 CROTEAU CT LLC, indicating an organization as the current owner.

Given its 1972 vintage and compact 1,196 Sq.Ft. footprint, the home sits at the smaller end of the local sales inventory while aligning more closely with the size of nearby rentals. The age suggests the potential relevance of modernization or maintenance considerations typical for properties of this era, without specific condition data provided here. Its configuration as a 5-bedroom home sets it apart from many nearby rental comps that skew toward 3 bedrooms.

These characteristics point to a marketing strategy that emphasizes functional space efficiency and bedroom count in the rental market, while relying on price-per-square-foot normalization in the sales market due to its smaller size relative to active listings. Pricing and demand will be influenced by how well the property's condition, finishes, and layout resonate with local expectations, especially if aiming to justify the comp-implied valuation and upper-band rents.

## Sales Market Analysis

### Sales Market Overview



The local sales set includes 16 listings with a median price of $529,000 and a median price per Sq.Ft. of $172.97 (average $198.56). Prices range from $440,000 to $1,058,000, and price per Sq.Ft. spans $143.59 to $290.43. Living areas average 3,013 Sq.Ft. (median 2,725 Sq.Ft.), ranging from 1,822 to 6,642 Sq.Ft. Days on market average 34.94, with a median of 22, ranging from 4 to 86.

This distribution reflects a broad spectrum in both price and property size, with a relatively modest median price per Sq.Ft. compared with the upper bound, indicating variability in quality, condition, or micro-location. The median 22 days on market indicates active turnover, while the spread to 86 days suggests outliers or premium-priced listings lingering longer. The subject is notably smaller than typical listings, emphasizing the importance of normalizing by size.

For the subject property, these dynamics suggest pricing should be anchored to price per Sq.Ft. rather than absolute price to maintain market compatibility. The relatively quick market velocity supports a confident marketing approach, while the broad price-per-Sq.Ft. band underscores the need to position condition and presentation to align with the desired pricing tier.

## Comparative Market Analysis (CMA)

| addressLine1 | bedrooms | bathrooms | squareFootage | yearBuilt | price | pricePerSquareFoot |
|---|---|---|---|---|---|---|

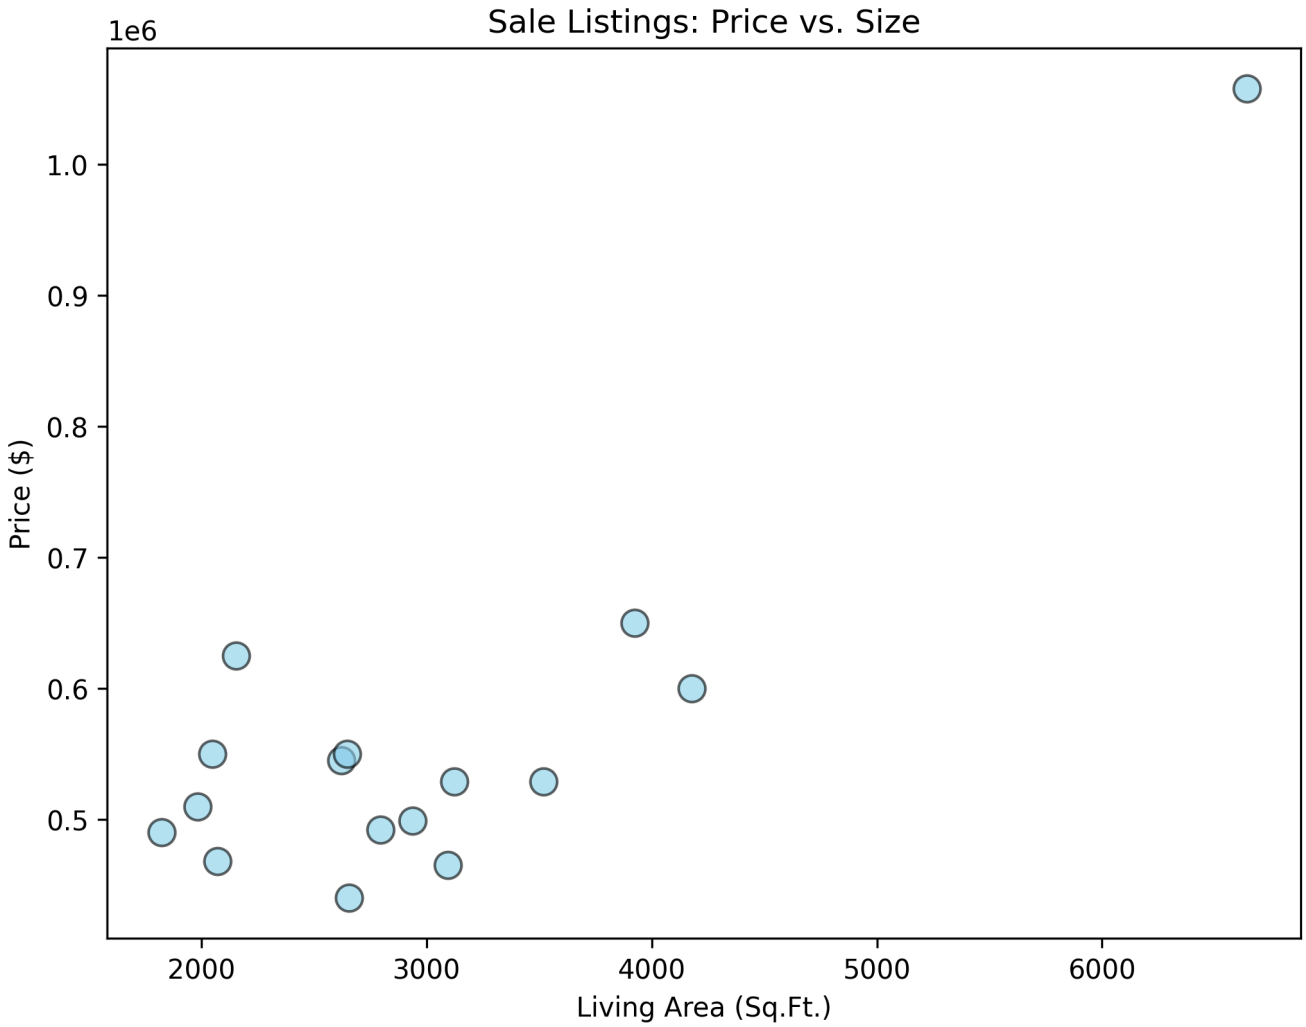
| | | | | | | |
|---|---|---|---|---|---|---|
| 780-782 Belmont St | 5.0 | 2 | 2622 | 1930 | 545000 | 207.86 |
| 188 Leda Ave | 5.0 | 3 | 2794 | 1927 | 492000 | 176.09 |
| 202 Leda Ave | 4.0 | 2 | 1822 | 1920 | 489900 | 268.88 |
| 340 Harrison St | 4.0 | 2 | 1983 | 1890 | 509900 | 257.14 |
| 181 Russell St | 6.0 | 2 | 2646 | 1925 | 550000 | 207.86 |

The top five comps are largely larger, older homes, ranging from 1,822 to 2,794 Sq.Ft., built between 1890 and 1930, with bedroom counts from 4 to 6 and bath counts primarily at 2. Price per Sq.Ft. ranges from $176.09 to $268.88, with several clustering in the low-to-mid $200s. Sale prices run from $489,900 to $550,000.

Compared to the subject, these comps offer more square footage and older vintages, but with similar bathroom counts and overlapping bedroom configurations. The broader size and age differences necessitate reliance on price per Sq.Ft. to align valuation for the subject's smaller footprint. The mix of PPSF in the low-$200s pushes the comp-implied value above the area's median PPSF baseline.

Overall, the comp set provides directional support for a higher PPSF relative to the overall market median, but it introduces considerations given age and size dissimilarity. While useful, adjustments for size and potential condition would be prudent conceptually; the comp-implied approach remains informative but should be applied with awareness of these comparability constraints.

## Value Estimate



The baseline value based on the area's median price per Sq.Ft. is 172.965 × 1196 = 206,866.14. Using the average price per Sq.Ft. of the selected comps, the comp-implied value is 223.566 × 1196 = 267,384.94. The price vs. size context further grounds these figures within observed market patterns.

The comp-implied value exceeding the baseline reflects the comps' higher PPSF profile and suggests that, if positioned similarly, the subject could command pricing toward that tier. Given the subject's smaller size relative to the active inventory, PPSF approaches provide a more stable normalization across the broad size distribution.

Confidence in the value is moderated by dispersion in PPSF and the subject's divergence from the larger, older comp cohort. The dual-method framing—baseline and comp-implied—helps bracket expectations, with the scatter indicating room for variance based on condition, quality, and micro-location.

## Valuation Sensitivity

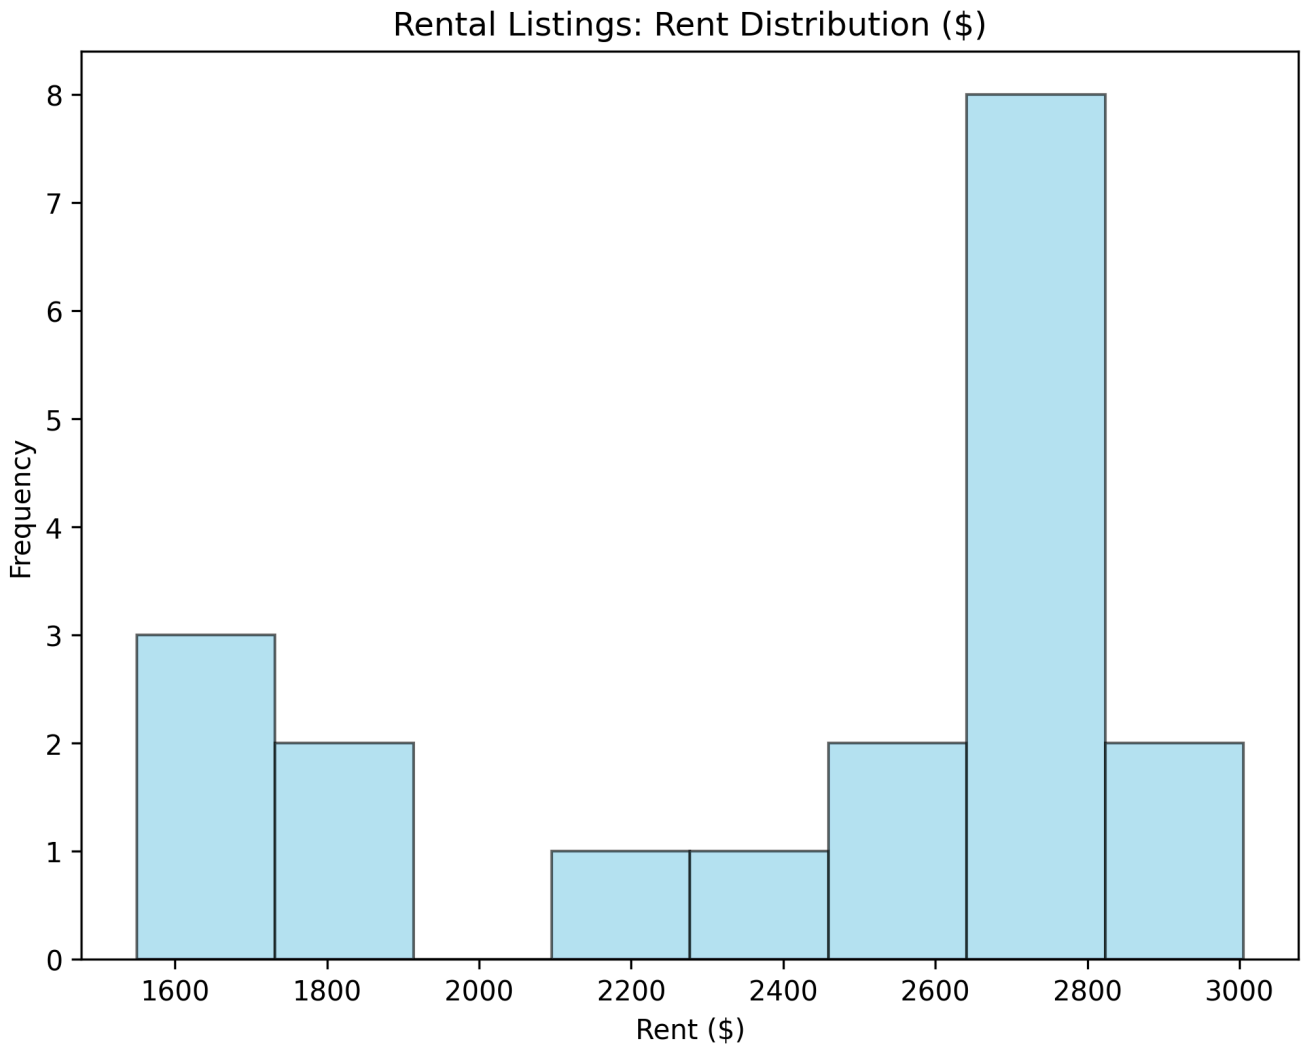
The PPSF sensitivity range yields a minimum estimate of 143.59 × 1196 = 171,733.64 and a maximum of 290.43 × 1196 = 347,354.28, bracketing the comp-implied estimate of 267,384.94. This defines the plausible spectrum given market extremes.

At the low end, pricing aligns with properties under tighter condition constraints or less favorable micro-locations. The upper bound corresponds to premium condition and amenity execution or highly advantageous positioning within the submarket. The subject's actual placement within this band will hinge on its finish level and presentation.

Strategically, this range supports a pricing plan that targets the comp-implied value while allowing flexibility for negotiation. Monitoring buyer response and days on market will be important to validate positioning and adjust swiftly to maintain velocity.

# Rental Market Analysis

## Rental Market Overview



In the rental market, 19 active listings show a median rent of $2,720 and a median rent per Sq.Ft. of $2.57 (average $2.36). Rents range from $1,550 to $3,005, and rent per Sq.Ft. spans $1.26 to $2.78. Unit sizes average 1,048.79 Sq.Ft. (median 1,004 Sq.Ft.), from 700 to 1,980 Sq.Ft. Rental days on market average 68.32, with a median of 43, ranging from 6 to 244.

The data indicate clustering around 1,000 Sq.Ft. units and mid-$2,000 rents, with a slower leasing cadence than the sales market. The subject's 1,196 Sq.Ft. sits slightly above the rental median, aligning reasonably with the active stock by size. The upper rent bound of $3,005 within current listings suggests a relatively tight ceiling for observed asking rents.

For the subject, this environment supports achievable monthly rent around $3,100–$3,200 when scaled by rent per Sq.Ft., assuming competitive condition. The slower rental velocity suggests that pricing precision, marketing, and timing will be critical to attain target rents without extending vacancy.

## Comparative Market Analysis (CMA)

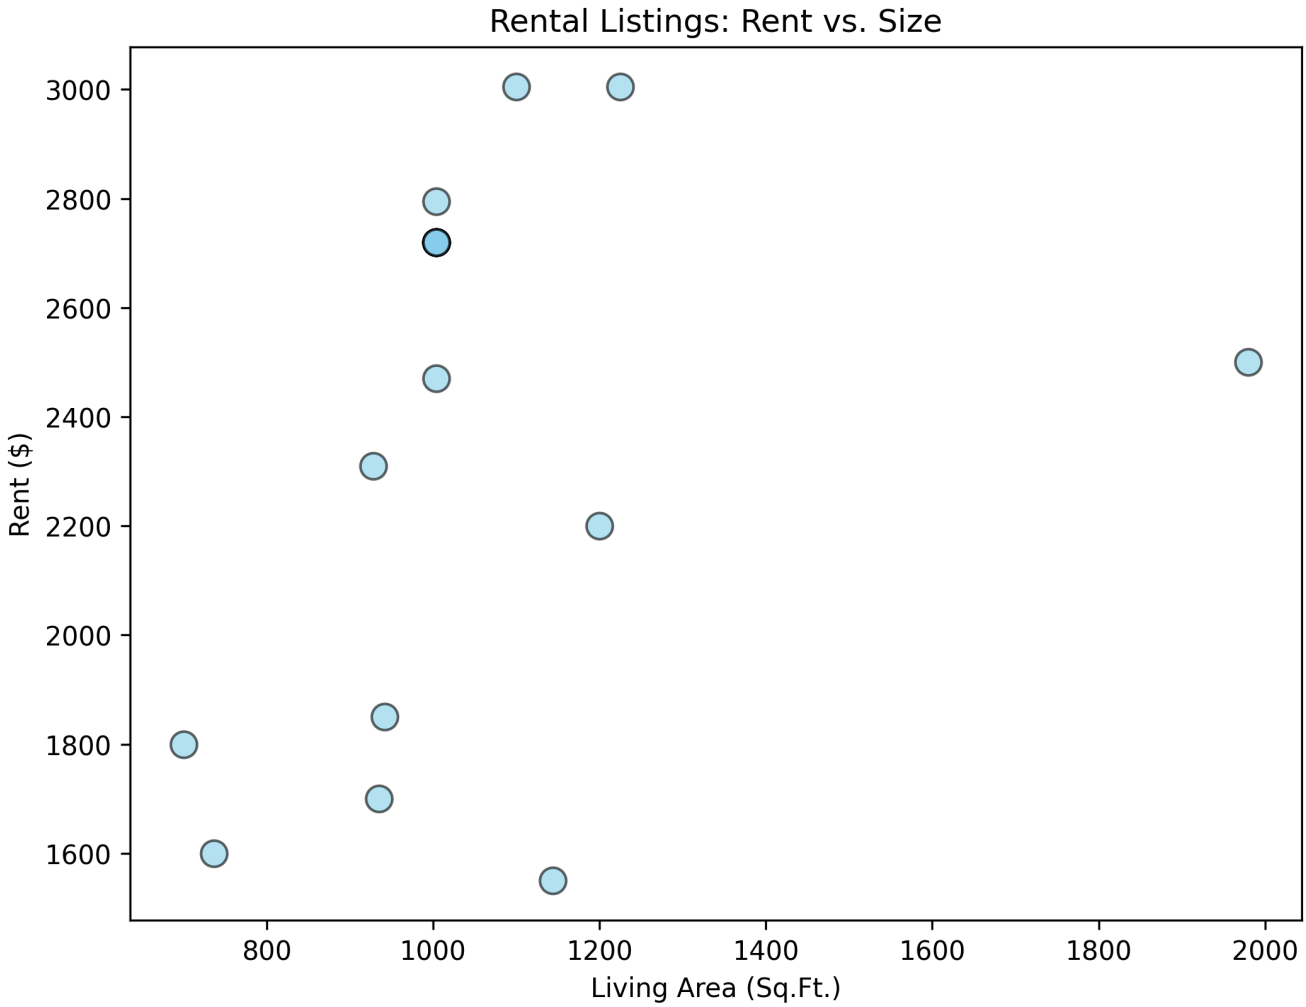
| addressLine1 | bedrooms | bathrooms | squareFootage | yearBuilt | rent | rentPerSquareFoot |
|---|---|---|---|---|---|---|
| 501 Kennard Rd | 3 | 1.5 | 1225 | 1969.0 | 3005 | 2.45 |
| 1027 Mammoth Rd | 3 | 1.5 | 1100 | 1969.0 | 3005 | 2.73 |
| 388 Kennard Rd | 3 | 1.5 | 1004 | 1969.0 | 2720 | 2.71 |
| 396 Kennard Rd | 3 | 1.5 | 1004 | 1969.0 | 2720 | 2.71 |
| 371 Kennard Rd | 3 | 1.5 | 1004 | 1969.0 | 2720 | 2.71 |

The rental comps are predominantly 3-bedroom units built around 1969, sized between 1,004 and 1,225 Sq.Ft., with rent per Sq.Ft. from $2.45 to $2.73. Achieved or asked rents cluster at $2,720 to $3,005. This set collectively centers around the submarket median RPSF.

Relative to the subject, the comps are similar in era and close in size but offer fewer bedrooms, which can influence per-unit pricing and tenant appeal. The RPSF convergence near $2.57–$2.71 lends support to the subject's baseline and comp-implied rent expectations with modest lift.

These comps underpin a rent expectation in the low-$3,000s on a normalized basis, though the bedroom differential suggests the subject's overall rent could be competitive if layout efficiency and condition align with tenant preferences. Adjustments for configuration and quality would guide where within the supported range the subject should price.

## Rent Estimate



Applying the median rent per Sq.Ft., the baseline rent is 2.57 × 1196 = 3,073.72 per month. Using the average rent per Sq.Ft. from the selected comps, the comp-implied rent is 2.662 × 1196 = 3,183.75 per month. The rent vs. size context shows these estimates are consistent with observed patterns for similarly sized homes.

The tight alignment between baseline and comp-implied rents points to stable pricing around $3,100–$3,200 per month. The comps' RPSF slightly above the median suggests modest upside if the subject's condition and presentation merit it. Conversely, deviation in quality could nudge the achievable rent closer to the baseline.

Given rental market velocity and the subject's size, the comp-implied figure provides a reasonable target with sensitivity to seasonal timing and marketing execution. In practice, a narrow initial pricing spread can help minimize days on market while testing depth of demand.

## Rental Sensitivity

Minimum estimated rent, based on the market's low RPSF bound, is 1.26 × 1196 = 1,506.96 per month, while the maximum is 2.78 × 1196 = 3,324.88 per month. These endpoints outline the feasible rent spectrum observed in the area.

The low end reflects scenarios such as off-season leasing, condition-driven discounts, or less advantageous positioning, whereas the high end is associated with stronger finishes, favorable timing, and optimal comparables. Given the comps and baseline alignment, the subject's likely band centers near the $3,100–$3,300 range under typical conditions.

Strategically, setting an initial ask nearer the comp-implied level with readiness to adjust can balance rent maximization against occupancy. This approach supports cash-flow stability while probing for premium rent if market response is favorable.

# Market Dynamics and Segmentation

## Market Velocity

Sales listings average 34.94 days on market with a 22-day median, ranging from 4 to 86 days. Rental listings average 68.32 days with a 43-day median, ranging from 6 to 244 days. The share transacting within 30 days is 62.5% for sales and 36.84% for rentals.

These metrics underscore stronger liquidity on the sales side, where nearly two-thirds of listings transact quickly. Rentals move more slowly, suggesting a more deliberate search process by tenants or greater sensitivity to price and unit condition. The relative difference points to higher urgency among buyers than renters.

For the subject, this means a sale could proceed relatively quickly if priced to market, while leasing may require more time and tactical pricing to ensure absorption. Planning for potential vacancy intervals and aligning marketing to peak demand windows can mitigate holding costs.

## Market Segmentation

By bedroom count, median sale price per Sq.Ft. runs 225.98 (3 BR), 169.84 (4 BR), 191.975 (5 BR), 179.10 (6 BR), 157.995 (7 BR), 169.39 (9 BR), and 159.29 (14 BR). On the rental side, median rent per Sq.Ft. registers 2.065 (1 BR), 1.825 (2 BR), and 2.710 (3 BR). The subject's relevant sales segment median for 5 BR is 191.98, above the overall market median of 172.97.

This segmentation shows that, within sales, 5-bedroom homes command a higher PPSF than the overall market median, while rental data is concentrated among smaller units, with 3-bedroom rentals achieving the highest RPSF among those segments. The subject's 1,196 Sq.Ft. is much smaller than the sales median (2,725 Sq.Ft.) and modestly larger than the rental median (1,004 Sq.Ft.).

Implications for the subject include emphasizing PPSF normalization on the sales side and carefully positioning rent against the 3-bedroom-dominated rental segment. Marketing should highlight the additional bedrooms efficiently within the compact footprint to appeal to price-sensitive households seeking space value.

# Demographic and Economic Analysis

## Growth Trends

The area has 9,075 residents and 4,073 households. From 2020 to 2025, population declined slightly at -0.4% annually while households grew at 0.65% annually. Looking forward to 2025–2030, population is forecast to increase 0.27% annually, and households are projected to grow 0.66% annually.

Recent trends suggest a mild contraction in population offset by steady household formation, with forecasts pointing to modest population recovery alongside continued household

growth. This pattern supports stable housing demand even amid demographic shifts.

For the subject and its submarket, gradual household formation bodes well for sustained occupancy and slow-and-steady demand for both ownership and rental options. Modest forward growth favors a durable outlook rather than rapid expansion.

### Economics and Affordability

Median household income is $104,238 and per capita income is $57,959. Median income is projected to grow 1.82% annually from 2025 to 2030. The unemployment rate is 1.2%. Educational attainment includes a 29.75% bachelor's degree share and a 15.80% graduate/professional degree share.

These indicators reflect strong purchasing power, high employment stability, and solid human capital—factors that typically underpin both sales demand and rent affordability. Projected income growth enhances the capacity to absorb price and rent increases over time.

For investors and owners, this economic base supports rent collections and reduces income-related risk, while also reinforcing price resilience. The combination of strong incomes and low unemployment complements the tight occupancy profile to stabilize cash flows.

### Housing Occupancy

Housing occupancy is 97.60%, with a vacancy rate of 2.40%. This indicates a very tight housing market with limited slack.

High occupancy typically supports firm pricing and minimizes leasing risk, provided units meet market expectations. Low vacancy also constrains options for renters, which can help sustain asking rents within observed ranges.

For the subject, this tightness improves the probability of maintaining occupancy and achieving near-target rents. It also supports price durability should a sale be considered, especially when combined with the region's income profile.

## Investment Analysis

The comp-implied estimated value is 267,384.94, and the comp-implied estimated monthly rent is 3,183.75. On these figures, the gross rental yield is 14.29%, and the gross rent multiplier is 6.999. These metrics are consistent with the submarket's observed ranges.

A yield in the mid-teens and a sub-7 GRM indicate strong income relative to value, assuming stabilization near the comp-implied rent. The baseline and comp-implied rent proximity adds confidence to underwriting near the low-$3,000s per month.

Investment appeal is reinforced by high occupancy and robust incomes, though rental velocity suggests attention to marketing and pricing discipline. The sensitivity band highlights valuation and rent dispersion risks, warranting a focus on condition and presentation to anchor returns.

## SWOT Analysis

| Strengths | Weaknesses | Opportunities | Threats |
|---|---|---|---|
| High occupancy rate (97.60%) supports stable demand. | Subject living area (1,196 Sq.Ft.) is well below sales median (2,725 Sq.Ft.). | Upper PPSF bound ($290.43) suggests upside with enhancements. | Rental market slower velocity (median 43 DOM; 36.84% ≤30 days). |
| Strong local incomes (median HH income $104,238). | Sales inventory skews much larger than subject, complicating direct comps. | Projected household growth (0.66%/yr) and income growth (1.82%/yr). | Historical population decline (-0.4%/yr) tempers demand outlook. |
| Sales market velocity: 62.5% sell ≤30 days; median 22 DOM. | Limited closely matched rental comps at 5 BR. | Rental RPSF near $2.57–$2.71 supports $3.1K–$3.2K rents. | Wide PPSF range (143.59–290.43) implies pricing volatility risk. |

The strengths center on tight occupancy, strong incomes, and brisk sales velocity, together supporting demand and income stability. Weaknesses include the subject's smaller footprint relative to sales comps and limited 5-bedroom rental analogs, which complicate direct comparisons. Opportunities are highlighted by the market's upper PPSF potential and projected household and income growth.

Threats involve slower rental absorption and historical population softness, alongside valuation volatility implied by the wide PPSF range. These factors can affect both time to lease and pricing certainty if not managed. Nonetheless, the confluence of demand drivers and income capacity provides a counterweight to these risks.

Mitigation focuses on condition upgrades, precise pricing, and targeted marketing to capture upper-tier PPSF/RPSF without extending days on market. Emphasizing the bedroom count within an efficient layout can broaden appeal, while ongoing monitoring of leasing velocity can guide timely adjustments.

# Conclusion and Recommendation

The analysis indicates a comp-implied value of approximately $267,385, with a baseline value of about $206,866 and a sensitivity range from $171,733.64 to $347,354.28. Rent expectations converge between $3,073.72 and $3,183.75 per month, with sensitivity spanning roughly $1,506.96 to $3,324.88. On these figures, the gross rental yield is 14.29% with a GRM of 6.999.

Market conditions—high occupancy, strong incomes, and fast sales turnover—support the investment outlook, while slower rental velocity calls for measured pricing and attentive marketing. The subject's smaller size relative to sales inventory makes PPSF normalization essential and underscores the importance of condition to reach the upper half of the supported range.

Recommendation: proceed, targeting the comp-implied valuation and rent while prioritizing unit upgrades and presentation to justify upper-tier PPSF and support faster lease-up. This approach balances income strength with market realities, positioning the asset to capture durable cash flow within the observed sensitivity bands.
